

# SECTION 10 – AUTHENTICATION, AUTHORIZATION AND SECURITY

# HOW JSON WEB TOKEN (JWT) AUTHENTICATION WORKS

# WHAT A JWT LOOKS LIKE

## Encoded

PASTE A TOKEN HERE

eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9.eyJpZCI6IjVjNzY4NWFlNGRhNWQ1NmYxZmY3MzU2MSJ9.UDDSyCLKrn38DQ03QgkGVFfobPFbWDYmb0dgsc5Yd-Y

## Decoded

EDIT THE PAYLOAD AND SECRET

HEADER: ALGORITHM & TOKEN TYPE

```
{
  "alg": "HS256",
  "typ": "JWT"
}
```

PAYLOAD: DATA

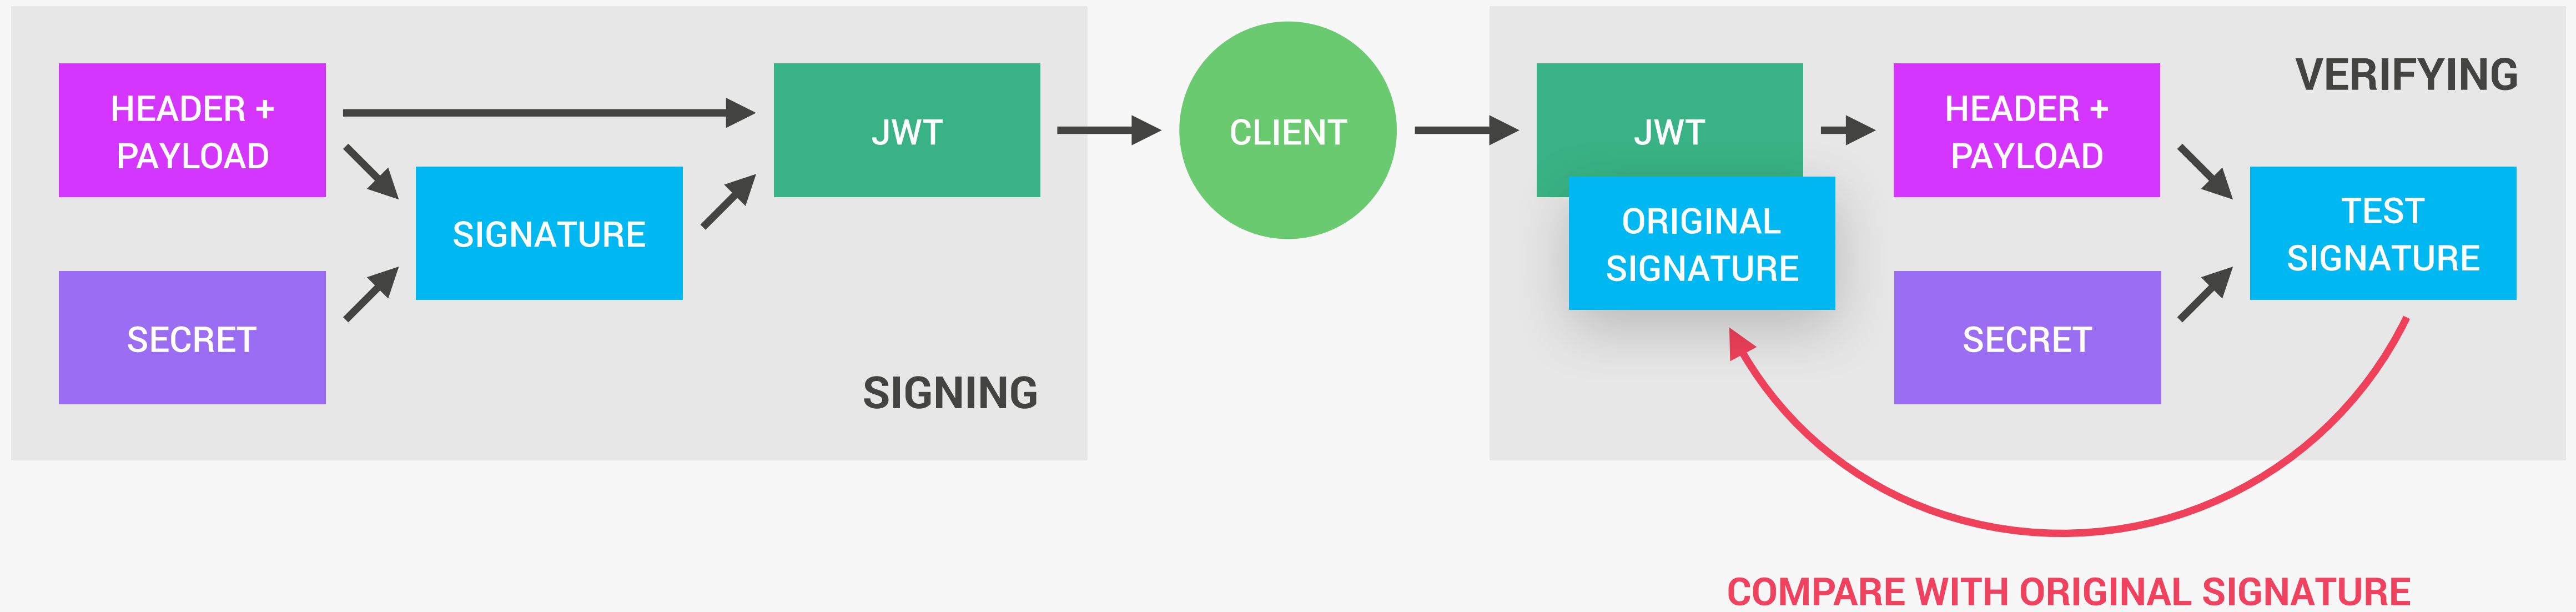

```
{
  "id": "5c7685ae4da5d56f1ff73561"
}
```

VERIFY SIGNATURE

```
HMACSHA256(
  base64UrlEncode(header) + "." +
  base64UrlEncode(payload),
  my-very-secret-secret
) ☐ secret base64 encoded
```

SECRET

# HOW SIGNING AND VERIFYING WORKS

Encoded

PASTE A TOKEN HERE

eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9.eyJpZCI6IjVjNzY4NWFiNGRhNWQ1NmYxZmYzMzU2MSJ9.UDDSyCLKrn38DQ03QgkGVFfobPFbWDYmb0dgc5Yd-Y

Decoded

EDIT THE PAYLOAD AND SECRET

HEADER: 

GORITHM & TOKEN TYPE

{  
 "alg": "HS256",  
 "typ": "JWT"  
}

PAYLOAD: 

DATA

{  
 "id": "5c7685ae4da5d56f1ff73561"  
}

VERIFY SIGNATURE

HMACSHA256(  
 base64UrlEncode(header) + "." +  
 base64UrlEncode(payload),  
 my-very-secret-secret  
) ☐ secret base64 encoded

test signature === signature 🙅 Data has not been modified 🙅 **Authenticated**

test signature !== signature 🙅 Data has been modified 🙅 **Not authenticated**

👉 Without the secret, one will be able to manipulate the JWT data, because they cannot create a valid signature for the new data!

# SECURITY BEST PRACTICES AND SUGGESTIONS

## 👉 COMPROMISED DATABASE

- ✓ Strongly encrypt passwords with salt and hash (bcrypt)
- ✓ Strongly encrypt password reset tokens (SHA 256)

## 👉 BRUTE FORCE ATTACKS

- ✓ Use bcrypt (to make login requests slow)
- 📦 Implement rate limiting (express-rate-limit)
- 🔬 Implement maximum login attempts

## 👉 CROSS-SITE SCRIPTING (XSS) ATTACKS

- 📦 Store JWT in HTTPOnly cookies
- 📦 Sanitize user input data
- 📦 Set special HTTP headers (helmet package)

## 👉 DENIAL-OF-SERVICE (DOS) ATTACK

- 📦 Implement rate limiting (express-rate-limit)
- 📦 Limit body payload (in body-parser)
- ✓ Avoid evil regular expressions

## 👉 NOSQL QUERY INJECTION

- ✓ Use mongoose for MongoDB (because of SchemaTypes)
- 📦 Sanitize user input data

## 👉 OTHER BEST PRACTICES AND SUGGESTIONS

- ✓ Always use HTTPS
- ✓ Create random password reset tokens with expiry dates
- ✓ Deny access to JWT after password change
- ✓ Don't commit sensitive config data to Git
- ✓ Don't send error details to clients
- 🔬 Prevent Cross-Site Request Forgery (csrf package)
- 🔬 Require re-authentication before a high-value action
- 🔬 Implement a blacklist of untrusted JWT
- 🔬 Confirm user email address after first creating account
- 🔬 Keep user logged in with refresh tokens
- 🔬 Implement two-factor authentication
- 📦 Prevent parameter pollution causing Uncaught Exceptions
